

FUNCTIONAL NEUROLOGICAL DISORDER

What is Functional Neurological Disorder?

Functional Neurological Disorder (FND) is a common condition of abnormal nervous system function which can lead to motor symptoms such as tremor or paralysis, sensory or visual changes, speech changes, cognitive changes or seizures. Functional conditions may also co-exist with other health conditions as well, sometimes making it difficult to identify.

How can we help?

Our Neurological physiotherapists have experience in working with people with Functional Neurological Disorders and can support you through individualised rehabilitation and recovery pathways. We also understand that a consistent approach in combination with your other health professionals is also important, and we can liaise with them as needed.

Services

- 1:1 Consultation with a physiotherapist.
- Hydrotherapy
- Multidisciplinary collaboration with your other health care providers
- FND Workbook and home exercise programs
